

# EarthRanger 2.26 Release Notes

June 2021

## IMPROVEMENTS

---

EarthRanger to EarthRanger Report Sync - EarthRanger has added the ability to provide a one-way synchronization of entered reports between two different EarthRanger Systems. New reports, along with updates, will be transferred to a second system automatically for sites that share data. The reports on the destination EarthRanger will be Read-Only and all other EarthRanger features, such as filters, exports, time slider, heatmaps, etc., will work the same as with local reports.

Link to ER Community – In the EarthRanger User Interface, under the menu button in the top right corner, users can now link out directly to the EarthRanger Community Site.

Event Category API – The ability to retrieve and create events has been added to the EarthRanger API.

## FIXES

---

FIRMS – The FIRMS Fire detection service stopped updating based on a change on the provide side which requires a change in EarthRanger configuration. This has been made on all sites, but if issues persist, contact [support@earthranger.com](mailto:support@earthranger.com)

Report Feed Results – Fixed an issue that sometimes didn't update the report feed correctly when multiple pages of results were present while using Search.

ER Track Uploading – Fixed ER Track issue that wasn't correctly uploading reports after the credentials had expired.

ER Track Pending Queue – Addressed an issue which sometimes incorrectly reported number of items remaining in the pending queue.

TrackingMetaData API – Now correctly returns all chronfiles a non-SuperUser has access to see.

Event API – Queries that don't specify an upper range now return correct results
