

EarthRanger 2.17.1 Release Notes

February 2021

FIXES

Map Layer Clicking Twice – Fixed a situation that required two clicks to expand Map Layers

Patrol Segment Error – Fixed the case when a Patrol Segment was occasionally orphaned.

Patrol Auto Start Setting – Setting would sometimes remain on the User Interface after creating another patrol.

Track Length – Made the Track Length setting to “Match report filter” more clear to show that it is matching only the starting date, not the ending date.

Heatmap Refresh – Correctly refreshes the map after heatmap settings have been changed by the user.

Yesterday Report Filter – Now correctly only shows yesterdays reports instead of both yesterdays and todays.

Patrol Start/End – In the distance calculation, the distance now includes the length from Patrol Begin to the first actual patrol point. The Patrol End works the same way.

Patrol Cards – The list of patrols now correctly sorts when patrols are using the default Tracked By name.

Partial White Screen – Fixed a partial white screen that appeared when resizing the browser with EarthRanger running.
