

# EarthRanger 2.9.1 Release Notes

October, 2020

## ENHANCEMENTS

---

**Report Creation from Subjects and Tracks** – You can now create a report from the current location of a Subject. Simply click on the subject, or any location on the track, and you will see the familiar ‘+’ button to create reports. Creating a report from here will automatically fill in the location and time and will fill in Released By if the subject is a radio.

**ESRI Integration of Multiple Layers** – EarthRanger has the ability to connect directly to ArcGIS Online for management of GIS features. This simplifies syncing GIS assets with EarthRanger and reduces the effort in managing the assets across multiple platforms. We now support configurations that contain multiple layers

**Addax Subject Icon** – The Addax icon has now been added to available subject types.

## FIXES

---

**Disabled Choices Support** – Fixed an issue that was not correctly handling choices in report fields that had been disabled.

**Admin** – Event type values only support lower case values. The Admin has been enhanced to warn the user when unacceptable characters are being used.
